

Project #6

I began with a mostly empty starting point and imported a snake obj model. I added a bmp texture similar to what I used in the last project. I then rewrote the vertex and fragment shader files so that the texture could repeat correctly across the surface. The default mapping made the model look like a stretched sphere, with distortion near the top and bottom, so the updated mapping fixed that. I also added a time based effect so the texture slides along the length of the snake.
